

Grad Café Analytics Summary

1. Average GRE score of accepted PhD applicants

The average GRE score of accepted PhD applicants was nan based on applicants with available GRE scores.

2. Average GPA of accepted Master's applicants

The average GPA of accepted Master's applicants was 2.94 based on applicants with valid GPA values.

3. Shortcomings of inferring decision_date

Inferring decision dates from status text can be inaccurate because entries are user-written and may contain missing or inconsistent dates. The term value can also cause incorrect year assignments when decisions are posted outside the expected timeline.

4. Correlation analysis

The correlation analysis showed that GPA and GRE-related measures had a XX relationship. This suggests academic performance and GRE scores may be related, but one measure cannot reliably predict the other.

5. Accepted vs rejected GPA comparison

Accepted and rejected applicants had different/similar GPA averages. The statistical test showed that GPA was/was not significantly different between groups.

6. Chi-square test

The chi-square test showed that there was/was not a significant relationship between degree type and applicant origin.

7. Remaining data quality issues

Remaining issues include missing values, inconsistent text fields, possible duplicates, and self-reported data bias. These limitations mean the dataset may not fully represent all graduate applicants.
